(54) Title: A SERVICE-ORIENTED GAMING NETWORK ENVIRONMENT

(57) Abstract: A gaming services framework includes web services extensions and comprises a set of services, protocols, XML schemas, and methods for providing gaming system functionality in a distributed, network based architecture. Systems and methods provide a service-oriented framework for gaming and property management based upon internetworking technology and web services concepts. One aspect of the systems and methods includes a loosely coupled architecture that consists of software components that semantically encapsulate discrete functionality (self contained and perform a single function or a related group of functions - the component describes its own inputs and outputs in a way that other software can determine what it does, how to

invoke its functionality, and what result to expect). These components may be distributed and programmatically accessible (called by and exchange data with other software) over standard internetworking protocols (TCP/IP, HTTP, DNS, DHCP, etc.).
